A code line counter is the best way to know the exact number of lines in a source file. Every day, the current developer has to count the lines of the source code. This process is an annoying, complicated and redundant work. It is actually the most common misunderstanding in the programming world. The programmer will have to estimate the lines, then compare the result with the real number of lines. Unfortunately, such an unreliable work, can greatly reduce the quality and reduce the productivity of the whole team. This is why most developers try to use the online line counting tools. The quality of these tools is usually poor. Sometimes, they can even miss the source line completely. This is the first reason to use a reliable line counting tool. The second reason is that it saves a lot of money. You can save money because you will not have to count the lines by hand. The last reason is that it makes your work more easy and pleasant. With a reliable line counting tool, you don't have to go through time-consuming work. Just count the lines! And you will also know the exact percentage of your source code lines. When I decided to make a line counting tool, I had the following goals in mind: > Automate the process of counting lines. > Make the application easy to use. > Make the application work not only with Perl, but also with other languages. > Efficient line counting. > Make the tool open source. > A friend of mine asked me to make a line counting tool. > This tool is very useful, it saved a lot of time for everyone. How to use Code Line Counter Pro - Perl Version: The program's file size is just about 200 KB. It can be run by any computer with Windows operating system. This software will count lines within the open source files, also in Perl, PHTML, HTML and SQL. Step 1. Install the software > To install the Code Line Counter - Perl Version, you will need to have the Microsoft Visual Studio 2010 installed on your computer. It is free for everyone. > Check if the tool is compatible with your operating system. Step 2. Download and install the software. > Open the file at the download link and double-click the downloaded file to run the setup wizard. > After the setup is completed, run the software and enter the source code folder.
