RCBypass Download For PC

Microsoft System Management Server (SMS) and System Center SMS (SCSC) are used by System and Remote Administration Tools (SRTs) to allow remote system administration and monitoring of systems such as Windows operating systems and IBM Lotus Domino Servers. During this time of back to the basics, many companies are attempting to reduce their support overhead. Many of these are now resorting to using SMS or similar tools to remotely control and/or monitor systems such as Windows based Server and Microsoft Exchange servers. Unfortunately, SRTs are often not configured to work with Windows XP Professional or Windows Vista. Similarly, the changes that normally occur when a system is upgraded from one major Microsoft operating system version to the next, prevent SRTs from working with this version of Windows. One reason for this may be that MSRC does not allow remote access to Windows XP Professional or Vista. Another common scenario may involve a system which is not managed by SMS or SCSC. RCBypass addresses all of these concerns. It can operate on any system in any Windows environment where SMS and SCSC can be used. It can also operate with systems that are managed by other system management products, such as Quest's System Center or BSS's Integrity. For customers who want to remotely monitor or control Windows Vista and Windows Server 2008 systems, we offer RCBypass for both Microsoft Windows XP and Vista. However, this solution does not support Windows XP Professional. The same is true for Windows Server 2008.
