The computer is a pretty powerful multifunctional tool, which means it can process math expressions much faster and better than we do. Developers came out with quite the variety of calculators to help you in times of need. For instance, Clax offers different instruments to solve math expressions, convert units, and a couple more. Quick access to calculators from a main menu The setup process keeps you busy only for a little while, but to be able to enjoy what the application has to offer, you need to be sure that your computer is fitted with .NET Framework. Although packed in an installer, you can also deploy it on a thumb drive, because it doesn't bind itself to your system, and registry entries are not affected. A main window shows up on launch, letting you choose the type of calculator to bring up. You can choose from a regular calculator, unit conversion, statistics, as well as date calculation. On the bright side of things, each comes in its own window, and the main menu remains active at the same time, but you can't have more calculators of the same type on the screen. Manual input of expressions Don't be fooled by the rather awkward choice of functions and layout. There's no numeric keypad for input, nor any operators, but a couple of fields for input and result. You need to manually write down the expression of interest, which isn't limited to a single operator. There's also a rich help manual to provide thorough info on function support. Unit conversion is structured in several panes to handle angle and energy, area and weight, length, power, pressure, and volume, temperature and velocity, as well as time. There's also an individual calculator related to time which handles months and years. All calculators rely on the same style of input. In conclusion Taking everything into consideration, we can state that Clax is a powerful calculator which can solve a great variety of expressions. It contains an impressive set of functions, and even though input style is not like your average calculator, you're sure to make the most of what it has to offer. How to change a font size in GTK+2? 04:52 AM, May 24, 2014 It seems that many GNOME programs have hard-coded a font-size-setting for some reason, and so the question that pops up is “how to change the font size in GTK+2?”. I already know the answer to the question, but I like to start with some background on how programs generally deal with this. GTK+ is a library that provides the user interface to various GNOME and other programs. Among other things, GTK+ allows programs to display a menu bar, a status bar, buttons, and other controls on the screen. To do so, GTK+ provides two settings for each area: the first is the size of the portion of the screen that the control covers and the second is the size of its font. This is perfectly reasonable; the program should arrange these controls according to the size of the portion of the screen that it covers. They can adapt to the user’s preference in a way that does not ruin the other controls. So generally, when you see a red-orange control in a program’s interface, it has hard-coded a font-size to prevent scaling when changing the font size. The example program I am going to use an example program. This is a fork of a hello, world program that uses GTK+2. The original program uses a fixed-size text box (GtkTextView) that uses a fixed-size font, while this program adds a couple of buttons to change the font size. Here is the code, in a file with the name main.c: To compile the program, you can use “gtk-build-exe main.c”. When the program runs, the result looks like this: Another program using GTK+ If you check the preferences of the bash shell, you will notice that it displays text in a size that is according to the display characteristics of the shell. The size of characters is essentially determined in the same way for that of buttons in GTK+. On my computer, the shell-rendered dialogs are displayed with a font size of 18: Changing the font size I want to change the font size. The answer is surprisingly easy: `$> gtk-window-decorator --fontsize 5` The
