We create a personal online repository of art and creative works. By browsing through art from around the world, you can create your own sense of style and discover many influences on modern art and design. Anyone, from anyone, can contribute and share their own work.Q: Initialize TypeScript module with dynamic imported types Suppose I have a TypeScript module that depends on the existence of some JavaScript types. E.g. if my.module looks like this: /// declare module "my" { interface MyInterface { $: typeof jquery; } } I'm importing the module in a Node.js app using: /// var my = require("my"); So far so good. But now I want to change the type of $. So I modify the typings/globals/jquery/jquery.d.ts file like this: declare module "my" { interface MyInterface { $: typeof jquery; } interface JQuery { $: typeof $; } } This results in a "Could not find declaration file for module 'my'" error, because the export default $ syntax in jquery.d.ts doesn't match the $ syntax in my.module. Is there a way to tell TypeScript to check the declarations of my.module for types, rather than just the module's own namespace? A: Basically you can't do this because TypeScript doesn't support the export default syntax. There are some concepts to keep in mind though. What you can do is add an index.d.ts file that defines an external interface for

the $ global name. It would look something like this: declare namespace MyGlobalNameSpace { interface $ { MyType: MyInterface; } } This would allow you to write something like the following: var $: MyGlobalNameSpace 77a5ca646e

ReggelreTranslate Activation
